

# SLIP-RING MOTOR FOR CONTINUOUS DUTY <br> SLIP-RING MOTORS 

Output and dimensions to Frame $200 \sim 355$

## APPLICATION OF MOTORS

Motors are for continuous duty and are generally used in industry for driving various machines and equipments in continuous operation (S1) without frequent start-ups and reversals.

## MOTOR CONSTRUCTION

The motor frame is made of ribbed iron casting. The terminal box is protected by means of a cover with hole enabling easy access and observation of the sliding contact operation. Motor frame sizes 200-280 has the slip-ring head installed on the drive - end of the motor shaft. Dismounting and exchange of the brush holders may be carried out through the hole in the terminal box : dismantling of the bearing shield is not necessary.

Motors of frame sixes 315-400 has the slip-ring located on the motor non-drive end and they are accessible after removal of the protective covers.

Every motor is provided with an external fan on the non-drive end. All the motors of frame sizes 200-355 have the cooling system type, IC 01-41, while the motors of frame size 400 has the cooling system type IC 01-61 acc., to BN - 77/3010-13.

## TYPE AND SIZE OF APPLIED BEARINGS

Grease should be refilled every 1000-1500 hours of motor operation or at least once every 6 months. After 2.5 to 3 years of operation, the grease in the bearing chambers should be exchanged regardless of the time of operation. For the lubrication of the bearings LT 43 or LT 42 acc. to PN-72/C-96134, suitable for operation in the temperature range from -30 deg.C (243K) is used.

## Equivalents of LT43 and LT42 Greases :

a) Alvania 3-manufactured by SHELL
b) Baacon M-200-manufactured by ESSO
c) Energrease 1S3-manufactured by British Petroleum

## RATED POWER

Motor rated power is defined for continuous duty S1 at 50 Hz , coolant temperature 40 deg.C (313K), temperature rise limit complying with the insulation classes B or F and mounting at the altitude up to 1000 m above the sea level. For higher temperature and higher altitudes, admissible motor power output should be defined act. to the data as follows :

## STATOR WINDING

Motors with standard winding are intended for voltage $\mathrm{UN}=380$ and $415 \mathrm{~V}, 50 \mathrm{~Hz}$. Motors with special winding may be manufactured for voltage range 380 V to $660 \mathrm{~V}, 50 \mathrm{HZ}$. On special request the production of motors for voltages lower than 380V but not lower than 220 V may be agreed with the manufacturer.

## INSULATION CLASS

Insulation class act. to the PN/E-2050 complying with IEV/TC-2C/CO/3-V 1955 regulations, defines the max temperature permanently admissible, which does not damage the motor. Standard design motors of frame sizes 200-280 and 315-400 have stator and rotor windings of the class F.

| COOLANT TEMP. DEG. C | 40 | 45 | 50 | 55 | 60 | 65 | 70 | 75 |
| :--- | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Admissible power output in \% of <br> rated power for insulation class B | 100 | 96 | 92 | 87 | 82 | 77 | 72 | 67 |
| Admissible power output in \% of <br> rated power for insulation class F | - | - | - | - | 100 | 96 | 92 | 87 |

| Mounting altitude in meters <br> above the sea level | 1000 | 2000 | 3000 | 4000 |
| :--- | :---: | :---: | :---: | :---: |
| Admissible power output in 1\% <br> of rated power | $100 \%$ | $94 \%$ | $88 \%$ | $82 \%$ |

## THERMAL PROTECTION OF WINDINGS

Motors of frame sizes 200-400 may be provided with thermistors on special request. Thermistors protect the stator winding against excessive heating in case of:

- Motor overloading
- Exceeding of the permissible number of on off switches
- Single phase operation
- Supply voltage drop
- High temperature and restricted cooling

Resistor leads are connected to the terminal strip in the terminal box. Rotor winding will not be provided with thermistors.

## TERMINAL BOX

Terminal box in motors of frame sizes 200-400 is installed on top of the frame, which makes it possible to connect lead on the left or the right side. Terminal box contains the following:
© 3 terminals for stator winding (6 terminals on request)

- 3 terminals for rotor winding
© 2 terminals for thermistor circuit
© 1 terminal for zero lead or earth lead
Standard design motors of frame sizes 315-400 have two separate terminal boxes - one for the stator and one for the rotor. Stator terminal box contains 6 terminals for the stator winding, rotor terminal box contains 3 terminals.

To connect the thermistors, for the motors of frame sizes 200-280 cable glands type DVP 16 acc. to BN-72/3068-13 are provided.

## ORDERING OF MOTORS

While placing orders, the following informations should be given :
a) Motor type
d) Rotational speed
g) Mounting version
b) Rated power
e) Supply voltage
h) Degree of protection
c) Type of duty
f) Current frequency
i) Climatic version
